POWERING SEAMLESS GLOBAL MONEY MOVEMENT FOR YANGO

Agenda

01

How Yango Runs Payments Today

yuno

Yango runs one driver-recharge flow across markets with different rails in each one

THE SCALE TODAY

30+

countries across five regions — Africa, LatAm, MENA, Asia and Europe

$4B+

earned by Yango's partner drivers and couriers in 2024

~131k

monthly active drivers in LatAm

WHERE YANGO IS HEADING

- Become the everyday super-app for emerging markets — already live in 30+ countries across five regions
- Build its own financial layer: fleet financing with Yego, a stablecoin rail at Yango Food, and Yango Ventures backing regional startups
- Expand across LatAm with five new markets planned with Yego, Bogotá opening now, and a corporate segment scaling in Peru

REGIONAL WINNING RAILS

LatAm: wallets & instant rails: Yape/Plin, Nequi/Daviplata, Bre-B, QR Simple, Pago Móvil

Africa: mobile money is the rail: M-Pesa, MTN MoMo, Orange Money, Airtel Money

MENA: local wallets & instant transfers: Fawry, Vodafone Cash, InstaPay, STC Pay

Asia: Easypaisa, JazzCash and Raast in Pakistan; local wallets across Central Asia

3 out of every 4 recharge dollars in Yango want to travel on a local rail that is not connected yet

Source: compiled from public market data and central bank reporting, August 2026.

yuno

The current payment flow carries four challenges to scale across markets

1 YANGO COLLECTION

USER

CARD PAYMENTS · ALL MARKETS
Partner commission top-ups & user card payments

Unlimit*
inswitch* a transNetwork company

COLOMBIA		PERU		BOLIVIA		+30 countries
Pay-ins	Payouts	Pay-ins	Payouts	Pay-ins	Payouts

Pay Retailers		PayU				

2 PARTNER TO YANGO

PARTNER

Unlimit

YANGO

SOME ALTERNATIVE LOCAL RAILS IS NOT OFFERING

DAVIPLATA | Bre-B | yape | plin | USDT rails | Pago Móvil

A large share of recharge value settles outside the payment infrastructure, with no reconciliation and no data to route on

CHALLENGES IDENTIFIED

→ **Card binding fails on almost a third of attempts,**

The verification charge is processed by an acquirer with no local presence, so the issuing bank reads it as cross-border and blocks it.

→ **Fragmented Billing and Reporting Across 30+ Markets Blocks Unified Reconciliation**

Static PSP rules can't react to BIN, issuer health, or time-of-day, leaving auth uplift on the table. Different dashboards and reconciliation methods per operation.

→ **Go-To-Market Speed**

Every new market — and every new rail — means a new negotiation and a new integration before the first driver can top up.

→ **No Failover Strategy**

If the recharge rail goes down, drivers cannot fund a balance and cannot work. Dispersal already has real-time reliability through Cobre; collection has no equivalent and no fallback.

** MOR.*

yuno

02

The Proposed Model

yuno

Yuno adds the orchestration layer on the collection side. Cobre stays live for dispersal

YANGO

COLOMBIA | PERU | BOLIVIA | +30 countries

One integration owned by Yango

API

yuno

RISK CONDITIONS	RECONCILIATIONS	INSIGHTS
SMART ROUTING	CHECKOUT BUILDER	PAYOUTS
FRAUD & RISK	TOKENIZATION	CONNECTORS

Nequi | DAVIPLATA | pse | Bre-B | yape | plin | Zelle | QR simple | USDT rails | Pago Móvil

+460 Global Payment Partners & Methods

Expected Impact

+6 pp completed top-ups

+2 pp acceptance rate

NO MIGRATION

Yuno runs alongside the current setup. Dispersal through Cobre is not touched at any phase of the rollout.

BINDING CHARGE STOPS CROSSING A BORDER

Yuno connects Yango to an acquirer that is already local in the driver market, so the issuing bank sees a domestic transaction

NO LOCK-IN

If a vendor wins a country on live data, that country routes to it. If it stops winning, the routing rule moves it back.

NOVA FRAUD INTELLIGENCE

AI scoring on 5,000+ data points reduces false declines up to 75% and recover the recharge before the driver goes offline

yuno

Three steps from today's setup to orchestrated collection — with zero recharge traffic at risk

01

CONNECT

Yuno integrates alongside the current setup. No recharge traffic moves. Settlement into the Cobre account is validated end to end before a single driver touches the flow.

→

02

COMPARE

A share of recharges mirrors through Yuno, country by country. Approval and cost, rail vs. rail, on live traffic: the first head-to-head these four markets have ever had.

→

03

SCALE

The winning rail per market takes the traffic, in the sequence Yango sets. New rails and new countries arrive as configuration, with automatic failover active from day one.

NOTHING SWITCHED OFF

Dispersal through Cobre is untouched at every phase.

ONE SETTLEMENT ACCOUNT

Collection lands where dispersal already lives: no split funds.

REVERSIBLE BY DESIGN

Every step is a dashboard setting; traffic moves back the moment a rail stops winning.

yuno

The Opportunity

~$87.7M/ year

The network base: recharge volume the fleets collect

Colombia, Peru, Bolivia and Venezuela, on Yango's own August 2026 data: 38.9M transactions a year at a $2.25 blended ticket , with card approval already at 91.5% blended. These pay-ins are collected by roughly 80 fleets across LatAm , with Yango as the infrastructure layer above them.

~$3.2M/ year

On the card rail, where Yango is the merchant

$2.33M confirmed from card acceptance: only 68 to 70% of verification attempts bind today, because the acquirers have no local presence and the issuer reads the binding charge as cross border, against 90 to 92% once bound. Smart routing and local acquiring add +2.00pp in Colombia, Peru and Bolivia and +5.50pp in Venezuela, a range of $1.98M to $2.67M. Plus $0.88M estimated in MDR, moving Unlimit and Inswitch volume to local processing.

~$7.5M/ year

Network upside on the local rails, once the fleet flow is mapped

$7.26M from turning on the rail each market's drivers already hold, PSE and Bre-B, Plin, QR Simple and Pago Móvil, none live today (range $5.72M to $8.79M, Yuno benchmark, not validated). Plus $0.22M in APM fees. This value lands across the fleet network, not in Yango's own P&L, so it is scoped separately. Plus $0.32M one time in engineering avoided, and 13 months returned.

+3.2M/year

DIRECT, ON THE CARD RAIL YANGO CONTROLS

This is the part Yango captures itself: $2.33M confirmed from its own data, plus $0.88M estimated in card processing cost. On top of it sits $7.48M a year of network upside on the local rails and $324K one time in engineering, taking total identified value past $10.7M a year.

Start where Yango is the merchant: the card rail. Domestic acquiring and smart routing fix the binding failure that Unlimit and Inswitch cannot reach today, and that lever alone is already confirmed by Yango's own numbers. The local rails follow once the fleet pay-in flow is mapped. The proposed next step is a joint data sprint on processors, fees and methods per market.

yuno

One integration gives Yango every method it uses today, and every one it will need next

One integration reaches 460+ providers and 1,000+ payment methods.

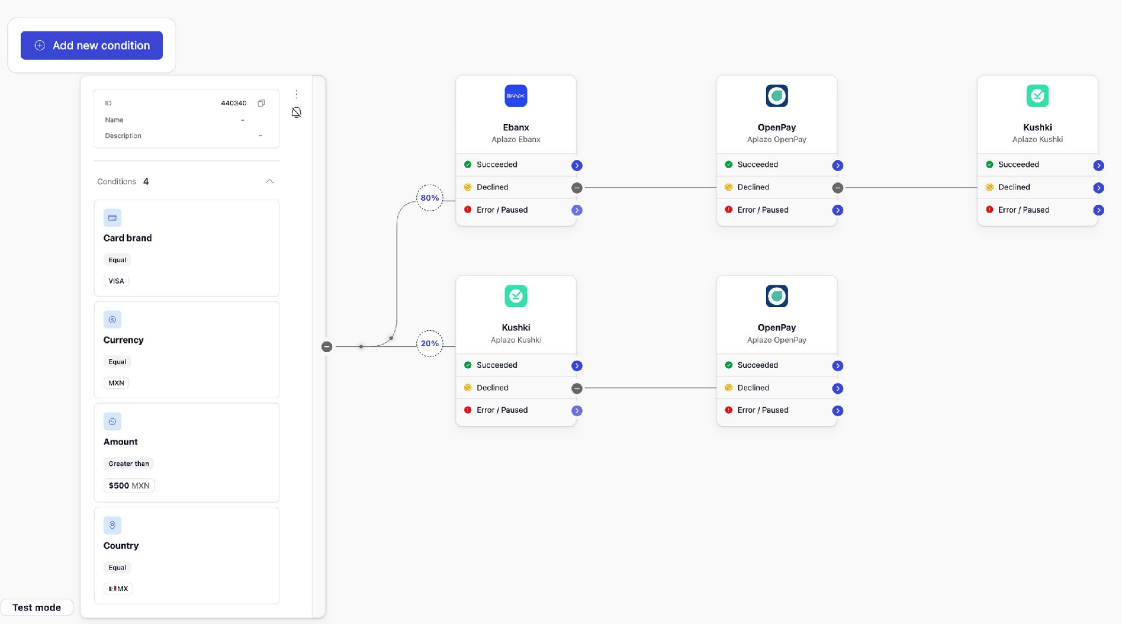
One no-code integration, central control across every region:

- **Colombia:** Nequi and Daviplata day one, PSE for larger recharges.
- **Peru:** Yape and Plin together from day one; covering only one leaves half the driver base behind.
- **Bolivia:** QR Simple as the free, universal primary rail, plus the USDT path Yango Food already runs.
- **Venezuela:** Pago Móvil as primary, USDT and Zelle for dollar-holding drivers.

yuno

Yango defines the conditions for each recharge, and Smart Routing turns them into the optimal decision in real time

Fully visual, as shown below, each condition branches to the best provider, with percentage splits and automatic fallback



Routing follows Yango's own rules.

Each recharge is directed using market, method, amount and Yango's own custom fields: driver ID, fleet, city

Best route, lowest cost.

Smart Routing picks the method and provider most likely to approve at the lowest cost in that country.

Failed attempts retry on another rail, automatically.

If a provider goes down or underperforms, traffic moves away — and the driver retries on a second rail inside the same session.

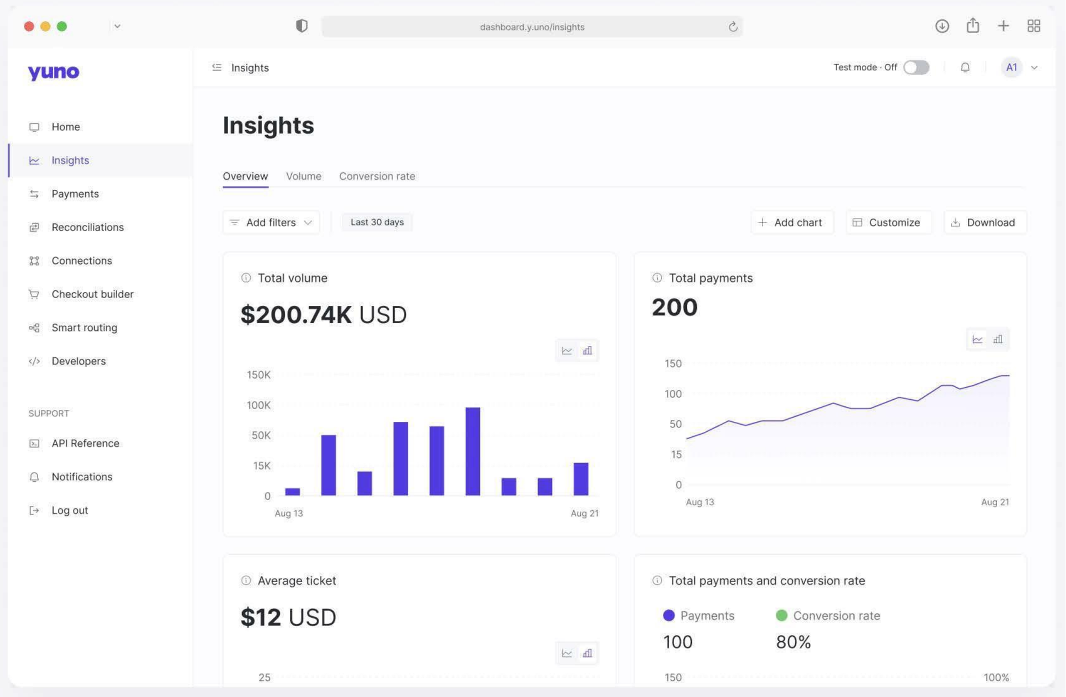
Every rail competes under the same rules.

Wallets, instant rails, stablecoins and cards measured on live approval and cost.

yuno

One source of truth for every recharge — including the volume that today never touches the stack

One live dashboard for the whole operation, from success rate to cost per recharge



Yuno's dashboard cuts processing time and human error, with clear, live data

Close the books without touching them.
Yuno ingests every provider's settlement files and matches them against Cobre's account automatically.

One financial source of truth.
A single reconciled view across the four markets, exported straight to Yango's ERP or data lake.

The blind spot, closed.
Cash and driver-side QR top-ups are invisible today; on orchestrated rails, every recharge is matched and visible.

Problems find you first.
Live monitors flag anomalies before they cost volume.

yuno

For failed top-ups, our approach is to recover the recharge before the driver goes offline

A failed top-up is not lost revenue alone — it is a driver off the road until it completes. Yuno attacks it in four layers, from day one

1 · PREVENT

Smart Routing

Each top-up starts on the **rail most likely to approve for that market, method and amount.**

2 · RETRY

Smart Retries

A declined recharge retries automatically on the next-best rail before the driver leaves the screen.

3 · REACH OUT

NOVA

The moment a top-up fails, **Yuno's AI agent reaches the driver** by WhatsApp or voice, in their language.

4 · CLOSE

One-tap payment links

The failed recharge becomes a one-tap link on an alternative method: balance funded, driver back on the road.

yuno

Payouts don't change, in any market Yango runs

Every market already has its own payout rail. Yuno never touches it, it keeps running exactly as it does today.

THE PRINCIPLE, EVERY MARKET

01

DRIVER EARNS

A ride, delivery or trip completes, and earnings are ready to disperse.

→

02

THE LOCAL RAIL ALREADY IN USE

Whatever pays drivers today in that market keeps running exactly as it does.

→

03

DRIVER IS PAID

Yuno never enters this flow, in any market. Collection is the only side Yuno touches.

STATUS BY MARKET

↗

Confirmed

Colombia: Cobre Fast Pay, real time, 120,000+ drivers paid today. Peru: Monnet.

↗

Open

Bolivia, Venezuela: payout equivalent not yet confirmed, an open item from discovery.

↗

To be mapped

Every other market: payout rail confirmed market by market as Yango expands.

yuno

Card binding fails on almost a third of attempts, before a driver can fund a balance

The verification charge is processed by an acquirer with no local presence, so the issuing bank reads it as cross-border and blocks it.

Driver
VERIFIES A CARD TO FUND THEIR BALANCE

01 · WHEN THE DRIVER ADDS A CARD
Verify BINDING CHARGE ON A NON-LOCAL ACQUIRER

02 · AT THE ISSUING BANK
Cross-border READ AS A FOREIGN TRANSACTION

03 · THE OUTCOME
Blocked THE CARD IS NEVER BOUND

ACQUIRER WITH NO LOCAL PRESENCE

Yango
THE BALANCE STAYS UNFUNDED

The failure concentrates almost entirely in this first step. **Once a card is bound, charges succeed at 90 to 92 percent**, so steady-state processing is not the problem.

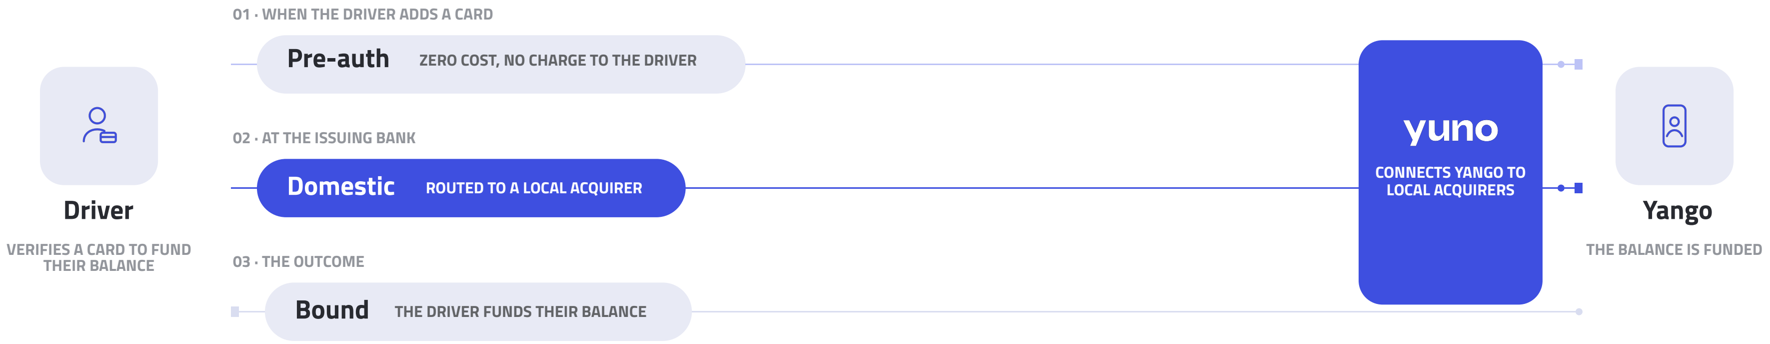
THE PROBLEM

Because the acquirer has no local presence, the issuing bank reads the verification charge as cross-border and blocks it . The driver cannot fund a balance, and cannot take a trip.

68–70% of card binding attempts succeed today

Yuno connects Yango to a local acquirer, so the binding charge stops crossing a border

Yuno does not acquire. It connects Yango to an acquirer that is already local in the driver market, so the issuing bank sees a domestic transaction instead of a foreign one.



Yuno is not the acquirer and never touches the funds. It is the connection layer: **one integration that reaches an acquirer already licensed in each market** , so the verification charge is domestic from the first attempt.

THE RESULT

A domestic verification charge removes the cross-border flag that is blocking these attempts, so binding can climb toward **the rate Yango already measures on bound cards**. The gap between the two numbers is the opportunity.

90-92% the steady-state rate once a card is bound

yuno

03

Why Yuno?

yuno

Why we believe Yuno is the right partner for Yango

TRULY GLOBAL ORCHESTRATOR

Global **provider coverage + local rails** to launch and scale markets fast

A DEDICATED TEAM FOR YANGO

On-the-ground team for **continuous support:** KAM, TAM, Solutions Engineer, and Fraud & Optimization specialists

PAYMENTS-AS-A-SERVICE FOR COMPLEX NEEDS

We **co-create, operate, and continuously optimize** your payments stack end-to-end

AWARD-WINNING AND RECOGNIZED BY CATEGORY LEADERS

Named a **World's Top Fintech Company and #1 Best Payment API (2025).** Trusted by Uber, Qatar Airways, Rappi, GoFundMe

INFRASTRUCTURE RESILIENCE

Engineered for high-concurrency and launch spikes. Currently supporting **high-velocity merchants** where uptime and latency are critical to the user experience

Every module activates standalone, and nothing obliges Yango to take the bundle

MODULE
PAY-IN ORCHESTRATION
Routing and retries across every connected provider.

MODULE
PAYMENT METHODS
More than 1,000 local methods on the same integration.

MODULE
PAYOUTS
Driver disbursement by bank, card or wallet, per market.

MODULE
KYC AND KYB
Portable onboarding, owned by Yango rather than a processor.

MODULE
FRAUD
Screening on both sides of the marketplace loop.

MODULE
RECONCILIATION
One ledger across every rail, matched back to transactions.

MODULE
TOKENIZATION
A PSP-agnostic vault, so cards stay valid when a rail changes.

MODULE
MOR NETWORK
More than 90 local entities on tap, market by market.

PROVIDER LAYER

stripe · Braintree · J.P.Morgan · adyen · mercado pago · d·local · cybersource A Visa Solution · **+460 integrations**

all under one API, one contract and one dashboard.

yuno

MARKETING & PARTNERSHIPS

APM partnerships

Drive adoption + commercial promotions.

- Co-marketing with each APM (Pix, UPI, BLIK, GCash, iDEAL...)
- Priority placement and badge inclusion in APM apps
- Joint campaigns and promotional rates per region
- Direct fee + commercial negotiations with each PSP

Embedded with 30+ local apms

TECHNICAL ACCOUNT MGMT

TAM team

Day-to-day platform health + decline analysis

- BIN-level decline analysis and routing optimization
- Issuer escalations on stuck and high-risk transactions
- Continuous tuning of retry logic and fallback paths
- Real-time dashboards and weekly business reviews

Same-timezone coverage across all regions

SALES ENGINEERING

Solutions engineers

Implementation + integration partner

- Direct integration support (single API, all PSPs)
- Per-market go-live runbook and migration support
- Custom checkout flow tuning per geography
- Sandbox, monitoring, and reconciliation setup

On-call during launches in every market

KEY ACCOUNT MGMT

Strategic KAM

Strategic partner + commercial QBRs

- Single point of contact across all regions
- QBRs on funnel performance and market expansion
- Net new market entry sequencing and prioritization
- Executive escalation owner for any platform issue

Senior owner aligned to Yango's roadmap

Global payment method coverage and **leading capabilities for payment routing and orchestration**, position Yuno as a best-in-class partner for Yango

Key Advantages

- 1000+ payment methods
- Day-one local coverage
- Higher approvals, lower cost
- Reporting and analytics

04

Yuno + inDrive

yuno

inDrive maintains one integration.

Yuno runs everything behind it.

A mobility business operating across four continents cannot hire its way out of payments. It has a coverage problem, a redundancy problem and a recovery problem — and all three sit below the app.

THE BUSINESS — INDRIVE TODAY

FOOTPRINT	GROSS BOOKINGS	REVENUE	DEALS COMPLETED	REACH	UNIT ECONOMICS
48	**$6.4bn**	**$601mn**	**8bn+**	**400mn+**	**Profitable**
countries · 1,100 cities worldwide	+30% year on year	+31% year on year	rides and orders to date	installs · 2nd most downloaded mobility app	positive adj. EBITDA and net income

THE PAYMENT LAYER BEHIND IT — BUILT, HELD AND OPERATED BY YUNO

PAYMENT METHODS LIVE

Cards · Wallets A2A · Cash

every locally relevant method, behind the same single integration

BUSINESS LINES

4

rides, delivery, intercity and financial services — new verticals inherit the rails

WHAT THAT LAYER RETURNED — H1 2026

PAYMENT APPROVAL RATE

94.5%

across every market, method and provider on the stack

RECOVERED BY ROUTING

~$10M

payments that failed on one provider and completed on another, mid-transaction

RECOVERED BY YUNO AI

+$5M

failures no acquirer can fix — NOVA, AI-led recovery

REVENUE RETURNED IN SIX MONTHS

$15M

Volume that would have been lost at the payment step. Recovered by the layer — not by inDrive's engineers, and not by anything they had to build.

yuno

Three neighbouring markets

Three national rails that did not exist five years ago.

Colombia, Peru and Bolivia sit within 2,000km of each other and share almost no payment behaviour. Each central bank built its own instant rail, on its own timetable, with its own rules — and each one is now where the volume lives. Adding them is not a roadmap item. It is the difference between being paid and not being paid.

Colombia

ACCOUNT-TO-ACCOUNT

A national instant-payment rail went live in October 2025 and rewrote the market in months. Nequi and Daviplata are primary accounts, not top-up wallets.

500M+ Bre-B transactions in its first five months, across 227 financial entities

34.7M users registered on the rail — from a standing start last October

77.8% of transactions are still cash, so digital rails and cash-out both have to work

YUNO'S MOVE

A rail this new is a configuration change on an existing integration, not a certification project competing with your roadmap. PSE's redirect into the rider's banking app is a known drop-off point, so the session is held and re-routed rather than declined.

Peru

WALLET-FIRST

The central bank mandated wallet interoperability in phases from 2023. The result is a market where the wallet, not the card, is the default instrument.

186M interoperable wallet operations per month as of mid-2025

~14M Yape users, with Plin at comparable scale — and the two interoperate

4 regulated phases, each one changing what riders expect at checkout

YUNO'S MOVE

Wallet outages are public events here — when one rail degrades, card and cash-voucher routes absorb the volume automatically. Yuno holds Mercado Pago, Kushki, Niubiz and PagoEfectivo so no single wallet failure is a revenue event.

Bolivia

QR-DOMINANT

The market most operators skip — and the most digitised of the three by rail share. Bolivia was the first country in Latin America to adopt fully interoperable QR.

92% of all digital payments run on QR Simple — 9 in every 10 operations

+131% QR growth in 2025 alone — 1,697 payments a minute, 28 every second

85→64% cash share of payments, 2020 to 2025 — the fastest shift in the region

YUNO'S MOVE

Card-first coverage misses this market almost entirely. Yuno contracts the local QR and wallet rails and holds the redundancy a thin provider market does not offer on its own.

05

Business Case

yuno

$3.21M+ per year on the card rail , and $10.7M+ identified in total across the four LatAm markets

With Yuno

	1.	2.	3.	4.
LEVER	Acceptance Rate Uplift	MDR Cost Optimization	Build/Run Avoidance	New-Methods Growth
HOW IT WORKS	Smart routing and local acquiring fix the card binding failure behind Yango's 68 to 70% verification success rate today	Local card processing against the cross-border rates Yango pays Unlimit and Inswitch today, with no local acquiring presence	One connector instead of five separate local-rail builds. Realized only when those rails are turned on, so it moves with lever 4, not with the card rail	Turning on the local rail each market's drivers already hold. This volume is collected by the ~80 fleets, not by Yango directly
TOTAL IMPACT	**$1.98M to $2.67M/yr**	**$0.88M/yr**	**$324K** one-time, plus 13 months of engineering time returned	**$7.26M/yr + $0.22M** range $5.72M to $8.79M, plus APM fees

yuno

The data behind this business case, straight from Yango's own numbers

Card is where Yango is the merchant. The recharge pay-ins below are collected by roughly **80 fleets across LatAm** , not by Yango directly, so this case leads with the card rail Yango controls and treats the local rails as network upside.

	🇨🇴 Colombia	🇵🇪 Peru	🇧🇴 Bolivia	🇻🇪 Venezuela
CASHLESS GMV, ANNUALIZED	$23.2M	$21.6M	$33.0M	$10.0M
AVG RECHARGE TICKET	$3.50	$3.20	$1.50	$2.80
TRANSACTIONS PER YEAR	6.6M	6.7M	22.0M	3.6M
CARD APPROVAL TODAY	92.6%	93.1%	91.3%	85.8%
	APM live: Nequi 80.5%	APM live: Yape 85.7%	No APM live today	No APM live today

FOUR MARKETS, COMBINED

- **$87.7M** cashless recharge GMV, annualized
- **$2.25** blended average recharge ticket
- **38.9M** recharge transactions per year
- **91.5%** blended card approval today

Card approval already clears 90% in three of four markets, but **only 68 to 70% of card verification attempts ever bind**, and Colombia runs on **Unlimit and Inswitch** with no local acquiring presence. That binding gap, not the approved cards, is the opportunity.

Source: Yango's own recharge data, July 2026. Card processors in Colombia (Unlimit, Inswitch) and the ~80-fleet pay-in structure. Processors, fees and methods for Peru, Bolivia and Venezuela are pending.

yuno

LATAM Cards, the rail where Yango is the merchant

KEY MARKETS*	Est. annual cashless recharge GMV (USD M)	Δ ACCEPTANCE RATE (%)**	Δ TPV (USD M)	COST REDUCTIONS (USD M)
Colombia	$ 23.2	2%	$ 0.50	$ 0.23
Peru	$ 21.6	2%	$ 0.46	$ 0.22
Bolivia	$ 33.0	2%	$ 0.72	$ 0.33
Venezuela	$ 10.0	5.5%	$ 0.64	$ 0.10
	$ 87.7		**$ 2.33**	**$ 0.88**

CONCLUSIONS

Card is the priority: it is the one rail Yango bills on directly, and today it runs on Unlimit and Inswitch with no local acquiring presence. By partnering with Yuno, across the four LATAM markets:

- **Yango** could boost its annual recharge volume by approximately **$0.50 million in Colombia, $0.46 million in Peru, $0.72 million in Bolivia and $0.64 million in Venezuela** , driven by improved acceptance rates through smart routing and higher authorization enabled by local processing.
- Today only **68 to 70%** of card verification attempts succeed, because Yango's acquirers have no local presence and the issuing bank reads the charge as cross border, against **90 to 92%** once a card is bound. Closing that gap is the **$2.33 million** above, on a range of $1.98M to $2.67M.
- Cost savings could reach around **$0.88 million** a year, on an estimated **1% saving** from local card processing, applied to card volume only. Colombia ($0.23M) is measured against the cross-border rates Yango pays Unlimit and Inswitch today; Peru, Bolivia and Venezuela ($0.65M) are estimated on the same basis, with their processors and fees still pending. Together with acceptance, that is $3.21 million a year on the card rail.

yuno

LATAM APMs, the network upside beyond the card rail

KEY MARKETS*	PROPOSED APMS (BASED ON CURRENT CHECKOUTS)	Δ TPV (USD M)*	COST REDUCTIONS (USD M)
Colombia	PSE, Bre-B	$ 2.32	$ 0.07
Peru	Plin	$ 0.65	$ 0.02
Bolivia	QR Simple	$ 3.30	$ 0.10
Venezuela	Pago Movil	$ 1.00	$ 0.03
		$ 7.26	**$ 0.22**

CONCLUSIONS

These pay-ins are collected by roughly **80 fleets across LatAm** , not by Yango directly, so this value is scoped as network upside and kept out of the card-rail total. By integrating **APMs** through Yuno:

- The network could unlock approximately **$7.26 million in additional annual recharge volume** , driven by turning on the rail each market's drivers already hold. This is **illustrative** , built on Yuno's benchmark, and should be read as directional until the fleet pay-in flow is mapped and a joint sizing exercise runs.
- **Bolivia is the clearest case**: QR Simple carries **94% of the country's interbank electronic transfers** , moves US$51.3B a year and charges no merchant fee, while Yango runs cards only there.
- Estimated annual cost savings of around **$0.22 million** could also be achieved, on **3% lower processing fees** with APMs against international card transactions. Bolivia's likely saving is higher still: QR Simple carries no merchant fee at all.

*Illustrative, on Yuno's benchmark for a crucial missing rail: 8 to 12% incremental transactions, 2 to 4% for Peru's Plin since Yape already covers most of the overlap. Not validated with Yango's data. **Cost reductions estimated at 3% of the incremental APM volume, and therefore illustrative on the same basis as the Δ TPV column. Totals are computed on unrounded figures, so they can differ by $0.01M from the sum of the rounded cells.

yuno

LATAM - Development costs savings

TEAMS INVOLVED ON INTEGRATION MATTERS	COST PER TEAM/MONTH	TOTAL COST PER INTEGRATION (3 MONTH/INTEGRATION)	TOTAL COST PER TEAM(FOR ALL THE INTEGRATIONS APMS + MOR PROCESSORS)

Engineering	$10,500.00	$31,500.00	$ 157,500
Fraud/Risk	$2,250.00	$6,750.00	$ 33,750
Treasury	$1,350.00	$4,050.00	$ 20,250
Compliance	$1,500.00	$4,500.00	$ 22,500
Finance	$1,125.00	$3,375.00	$ 16,875
Banking & Payments	$2,625.00	$7,875.00	$ 39,375
Total	**$21,600.00**	**$64,800.00**	**$ 324,000**

CONCLUSIONS

This saving is realized when the local rails are turned on, so it travels with the network upside, not with the card rail. By **centralizing all upcoming payment integrations** through Yuno's single API:

- **Yango** could save up to **$0.32 million in development costs** associated with the five missing local-rail integrations: PSE and Bre-B in Colombia, Plin in Peru, QR Simple in Bolivia and Pago Móvil in Venezuela.
- An estimated **13 months of engineering time** could be reallocated to core product work, **15 months multi-vendor against 2 months through Yuno** , instead of being spent building and maintaining five separate connections.
- No **MoR or processor** integrations are counted here. Yango already operates a processor in all four markets, so this is a consolidation, not a new-market entry.

Standard Yuno integration-cost benchmark: $21,600 per team per month, three months per integration, across five local-rail integrations. Not a quote of Yango's actual engineering cost.
