

Scaling Higgsfield's payment capabilities in priority international markets

Why a Yuno layer above Stripe unlocks global
growth fast

A blue rounded square containing the word "Higgsfield" in white text.

Higgsfield

AI video at a glance: a category that Higgsfield leads

\$847M TAM

AI video generator market 2026; ~\$3.35B by 2034, 18.8% CAGR (Fortune Business Insights, Aug 2026)

Analyst sizing lags the category: Higgsfield alone books ~\$700M against an \$847M 2026 estimate (The Business Research Company puts 2026 at \$1.04B). The category is being re-sized in real time, and most of that revenue now comes from businesses buying production capacity.

\$700M

Annualized revenue, Aug 2026, from ~\$10M in April 2025

Disclosed run-rates put Higgsfield first: Kling AI (Kuaishou) ~\$500M ARR in March 2026; Runway \$200M ARR in September 2026; MiniMax (Hailuo) \$79.0M revenue in 2025. On traffic, higgsfield.ai ranks #1,228 globally vs kling.ai #4,223 and runwayml.com #7,435 (SimilarWeb, Aug 2026).

30M+

Users across 238 countries and territories; 390 of the Fortune 500 (Aug 2026)

Usage is global by default and monetization is card-led by default. Stripe's case study puts 75% of Higgsfield's revenue outside the US, while the 95.6% authorization rate it quotes covers only the US, Europe and Australia.

#1

THE CATEGORY, CONCENTRATED IN ONE COMPANY

30M+ users. \$700M annualized revenue (Aug 2026), the highest disclosed in the category. Valued at \$5.4B, level with Runway (\$5.3B) and Luma (\$4B+). 75% of revenue outside the US. Where this category monetizes internationally is decided at Higgsfield's checkout.

WHAT DEFINES THE CATEGORY IN 2026

The aggregation era

Higgsfield sells one workflow over 30+ models: Kling 3.0, Seedance 2.0, Wan 2.7, Sora 2, Veo 3.1, Hailuo 2.3, plus its own Soul model. Switching cost is low; the winner is whoever removes friction fastest.

The enterprise turn

Businesses were under a quarter of revenue in January 2026 and the majority by August (FT via ContentGrip). Consumer and prosumer is now the ~30% that has to be monetized efficiently.

Big tech retreated from the standalone app

OpenAI discontinued the Sora app (Mar 2026; Sora 2 stays available through partners such as Higgsfield). Google ships Veo inside Gemini and Flow; Meta discloses no Vibes numbers.

When 75% of revenue sits outside the home market and the checkout is card-led, payments infrastructure becomes the growth lever. Every point of conversion, approval and renewal recovery lands directly on revenue.

Executive summary

~6.1M MAU

Addressable users in 18 markets where local rails dominate: UPI, Pix Automático, QRIS, PayPal, iDEAL, Bizum and others

Higgsfield already has material demand in its priority international markets; the question is how much converts to paid, recurring revenue. With ~12M monthly active users (Yuno-estimated from 30M+ registered users, Aug 2026) and 75% of revenue already outside the US, today's card-led checkout misses local payment behavior, suppressing free-to-paid conversion, card approval and renewal retention.

~\$21M/year

The largest share and ~83K incremental paid subscribers

Comes from audience expansion via local payment methods. With ~85% of Higgsfield's traffic outside the US, concentrated in markets where consumers default to local rails over international cards (India, Indonesia, Turkey, Vietnam, Brazil, Mexico), adding the right method per market lifts paid conversion by making the subscription path familiar, trusted and accessible.

~\$4M/year

The second and third levers add combined

Authorization uplift through local card processing recovers ~7K cross-border declines per year via local acquiring, MoR and domestic schemes (RuPay, TROY, Cartes Bancaires), most material in Brazil, India, Turkey and South Korea. Subscription continuity via retries and redundancy saves ~27K renewals annually from card expiries, auto-refill failures and renewal declines, particularly in the UK, Germany, India and South Korea.

~\$25M/year

IN PRELIMINARY GROSS
SUBSCRIPTION AND CREDIT REVENUE

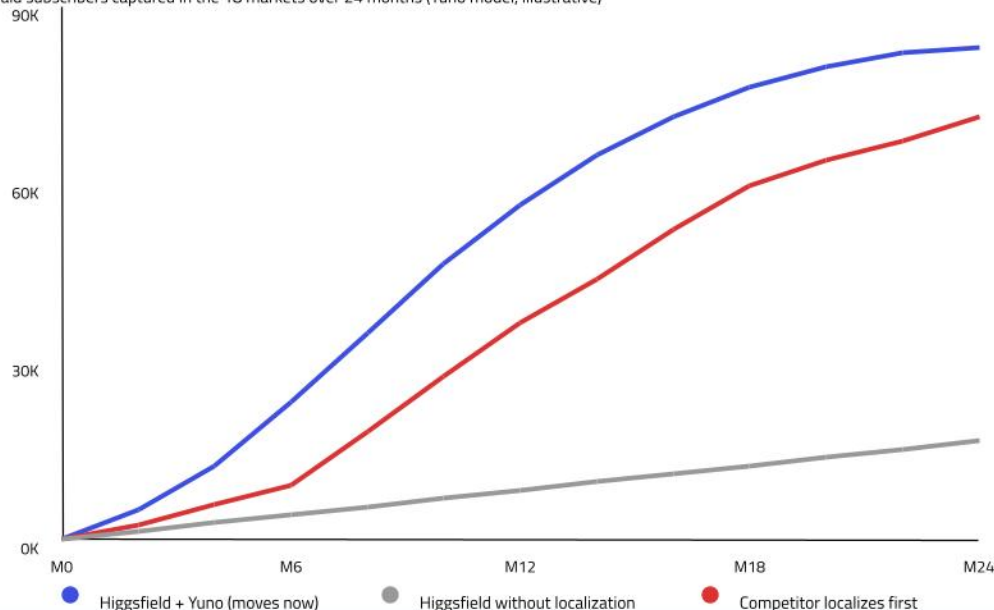

Higgsfield can unlock ~\$25M/year in preliminary gross subscription and credit revenue by fixing three payment leakage points across 18 priority international markets.

Higgsfield needs a payment-localization layer across its global payment stack: local methods where rails dominate, domestic routing where cross-border cards underperform, and recovery where payments fail. Yuno orchestrates that layer above Stripe. The proposed next step is a two-week joint data sprint to calibrate these estimates against Higgsfield's country-level checkout, authorization, renewal and ARPU data and produce an implementation roadmap.

Outside the US and EU, paid AI-video subscribers are near zero. This is a greenfield race, and first mover takes it

~6.1M Higgsfield MAU in 18 addressable markets (~12M globally). No AI-video competitor has localized checkout yet: Kling sells globally in USD via Stripe.

Paid subscribers captured in the 18 markets over 24 months (Yuno model, illustrative)

IN THESE 18 MARKETS, PAID AI-VIDEO SUBSCRIPTIONS ARE A BLANK SLATE.
There are no incumbents to displace, only users to convert.

COMPOUNDING COST OF DELAY

If Higgsfield delays, a localized competitor captures:

\$19M+ to first mover

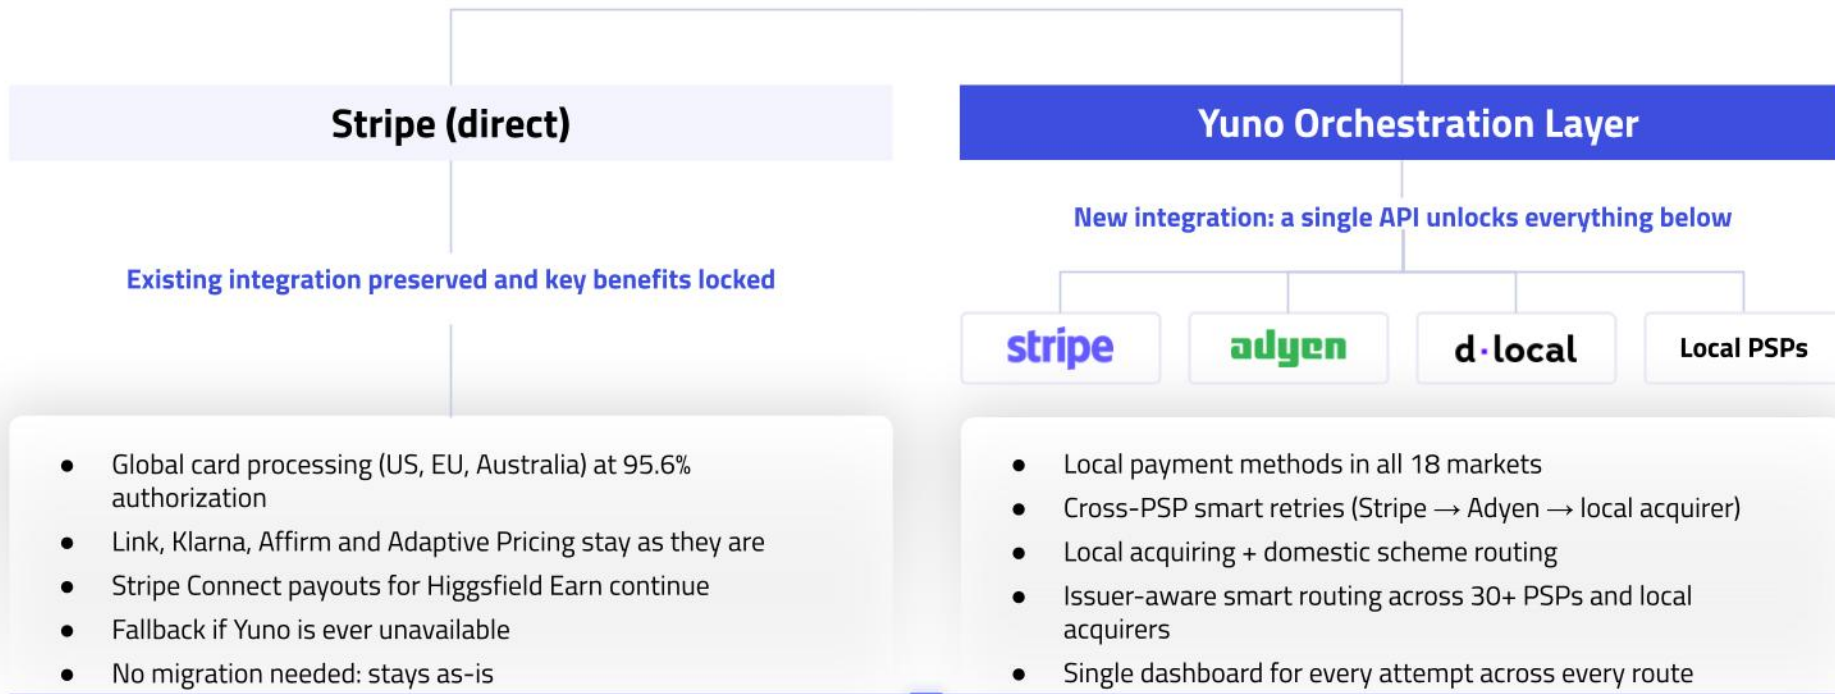

Stripe alone leaks revenue at four points. A second PSP only fixes one

To capture the full ~\$25M annualized opportunity, Higgsfield needs more than another acquirer. It needs orchestration plus local depth.

FOUR PAYMENT-FRICTION GAPS Where revenue leaks today	TODAY Stripe only Cross-border, card-led	OPTION A + Adyen / Checkout.com as 2nd PSP Two integrations	OPTION B + Yuno orchestration One integration · 30 PSPs · local ops
Local methods missing UPI, QRIS, PayPal, iDEAL, Bizum, SPEI... ~\$1.8M/mo at stake	 Limited to Stripe's native LPM list; help center: PayPal not supported	 Better, but EM gaps remain	 30+ local PSPs per market: full LPM depth
Cross-border card declines 25% EM cross-border decline (Yuno model) ~\$0.11M/mo at stake	 Cross-border routing only; 95.6% auth published for US / EU / AU only	 Has local acquiring but no MoR capability; US-entity limitations for Higgsfield	 Routes via Stripe + Adyen + 30 local acquirers
Renewal failures 3.5% monthly renewal failure in EM (model) ~\$0.24M/mo at stake	 Single provider, no fallback; Stripe retries, then cancels after ~14 days	 No cross-PSP retry between Stripe & Adyen	 Cross-PSP retries, token refresh, issuer-aware
No local expertise on the ground Regulators, BIN logic, issuer escalations, FX, settlement Enables 1–3 to actually work	 No in-country ops in 18 markets	 Adyen is also global; Higgsfield still builds in-house	 Yuno teams embedded per market: regs, declines, escalations
Option A captures a fraction of the \$25M. Option B captures the full \$25M, because Yuno includes redundancy plus the local rails and people a second PSP can't deliver alone.			

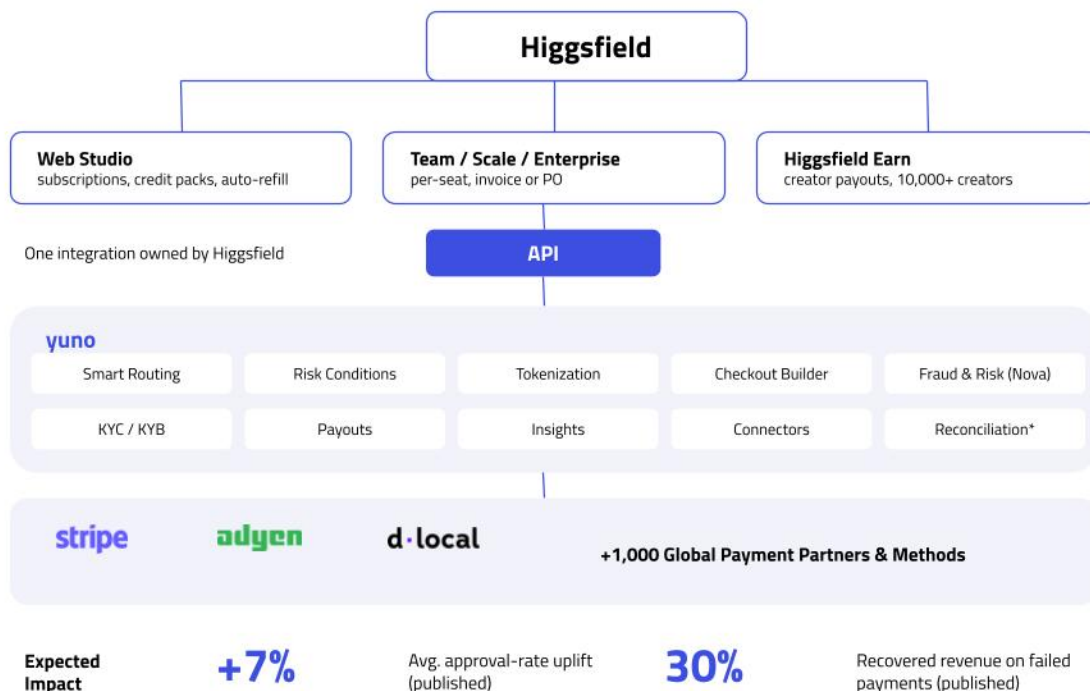

Keep Stripe direct. Add Yuno alongside it. Zero infra risk, full upside.

Higgsfield

Stripe stays live as your safety net. Yuno adds the orchestration layer around it: local PSPs, retries and local methods included.

From one processor to one global financial infrastructure

Smart Routing Engine

Route every subscription, credit pack and auto-refill across Stripe and local acquirers by BIN, issuer and market. Stripe keeps the traffic it already wins.

Failover + Recovery

Cross-processor cascade and retry logic recovers renewals that a single retry schedule gives up on, covering the dunning scope of Higgsfield's Lifecycle & Retention role.

1,000+ Local Methods

UPI, Pix Automático, QRIS, PayPal, iDEAL, Bizum, PayPay, SPEI and OXXO through one API, beyond card-only web checkout.

KYC / KYB, orchestrated

Onboard creators for Higgsfield Earn payouts (KYC already mandatory per the Trust page) and verify Team / Scale / Enterprise workspaces (KYB), with provider choice per market.

Taxes and merchant-of-record coverage

Sell locally without opening 18 entities: local tax handling, invoicing and settlement through Yuno's MoR and PSP-of-record partners per market.

Distribution deals

Yuno's BD team negotiates wallet co-marketing, priority placement, badge inclusion and promotional rates (UPI apps, Mercado Pago, GCash, Kaspi) on Higgsfield's behalf.

Yuno commits dedicated teams across every region: not just software

MARKETING & PARTNERSHIPS

APM partnerships

Drive adoption + commercial promotions.

- Co-marketing with each APM (UPI, Pix, QRIS, iDEAL, PayPal...)
- Priority placement and badge inclusion in APM apps
- Joint campaigns and promotional rates per region
- Direct fee + commercial negotiations with each PSP

Embedded with 30+ local APMs

TECHNICAL ACCOUNT MGMT

TAM team

Day-to-day platform health + decline analysis

- BIN-level decline analysis and routing optimization
- Issuer escalations on stuck and high-risk transactions
- Continuous tuning of retry logic and fallback paths
- Real-time dashboards and weekly business reviews

Same-timezone coverage across all regions

SALES ENGINEERING

Solutions engineers

Implementation + integration partner

- Direct integration support (single API, all PSPs)
- Per-market go-live runbook and migration support
- Custom checkout flow tuning per geography
- Sandbox, monitoring, and reconciliation setup

On-call during launches in every market

KEY ACCOUNT MGMT

Strategic KAM

Strategic partner + commercial QBRs

- Single point of contact across all regions
- QBRs on funnel performance and market expansion
- Net new market entry sequencing (incl. Kazakhstan and Central Asia)
- Executive escalation owner for any platform issue

Senior owner aligned to Higgsfield's roadmap

How we sized the three levers: start with existing demand, then remove payment leakage step by step

Preliminary outside-in estimate; Higgsfield's internal funnel data should replace Yuno's external assumptions.

STARTING POINT

0

~6.1M

Estimated Higgsfield
monthly active users

Across 18 addressable
markets.

Demand baseline - Higgsfield
internal data should replace this
estimate.

ADD LOCAL WAYS TO PAY

1

~\$1.8M/mo

~83K new paid subscribers

Local methods convert
Higgsfield users who can't (or
won't) pay with a global card
today.

FIX DECLINED CARDS

2

~\$0.11M/mo

~7K recovered paid
subscribers

Local card processing recovers
cross-border declines that
issuers would otherwise reject.

SAVE FAILED RENEWALS

3

~\$0.24M/mo

~27K annual renewals saved

Smart retries and provider
redundancy save renewals and
auto-refills lost to involuntary
churn.

PRELIMINARY TOTAL

4

~\$2.1M/mo

PRELIMINARY GROSS SUBSCRIPTION
AND CREDIT MRR IMPACT

~\$25M annualized

~90K new + retained users (base case)

WATERFALL LOGIC:

Local methods expand the paid base. Localized processing improves approval on remaining card attempts. Retries recover failed renewals on the resulting subscription base. Levers should not be interpreted as three independent user pools.

Beyond today's \$25M: being first to localize wins the next decade in emerging markets

Payment localization is the bottleneck no AI-video platform has cracked. Whoever solves it first becomes the default monetization path as demand inflects.

LOCALIZATION TAKES TIME

Multi-year head start that competitors can't copy overnight

Payment orchestration: 4 to 12 weeks per market.
Direct PSP integrations: 6 to 18 months each. Multiply by 20 to 40 markets, add local entity setup, regulatory work and operations on the ground, and the first mover holds a structural lead measured in years, not quarters.

4–12 weeks vs 6–18 months per market

DEMAND IS INFLECTING NOW

1.3B people in markets where AI-video adoption is just starting

The next 20 emerging markets hold ~1.3B people and ~0.9B internet users (DataReportal 2026), with penetration still rising in the largest ones (Nigeria 46%, Bangladesh 47%, Kenya 41%). Mobile money, wallets and instant rails are the default way these consumers pay online.

~1.3B population · ~0.9B internet users today

THE WINDOW IS SHORT

Global AI-video competition is racing into the same markets

Google gives Jio's unlimited-5G users 18 months of Google AI Pro with Veo at no cost, all ages since Nov 2025 and still live. In AI video, no one has localized checkout yet: Kling (~\$500M ARR, Mar 2026) sells its global plans in USD via Stripe.

Payment infra is the moat that models can't catch up to

CAPTURE TODAY / WIN TOMORROW:

~\$25M annualized in the 18 priority markets, and market control across the next 20 emerging markets where AI-video demand is just starting.

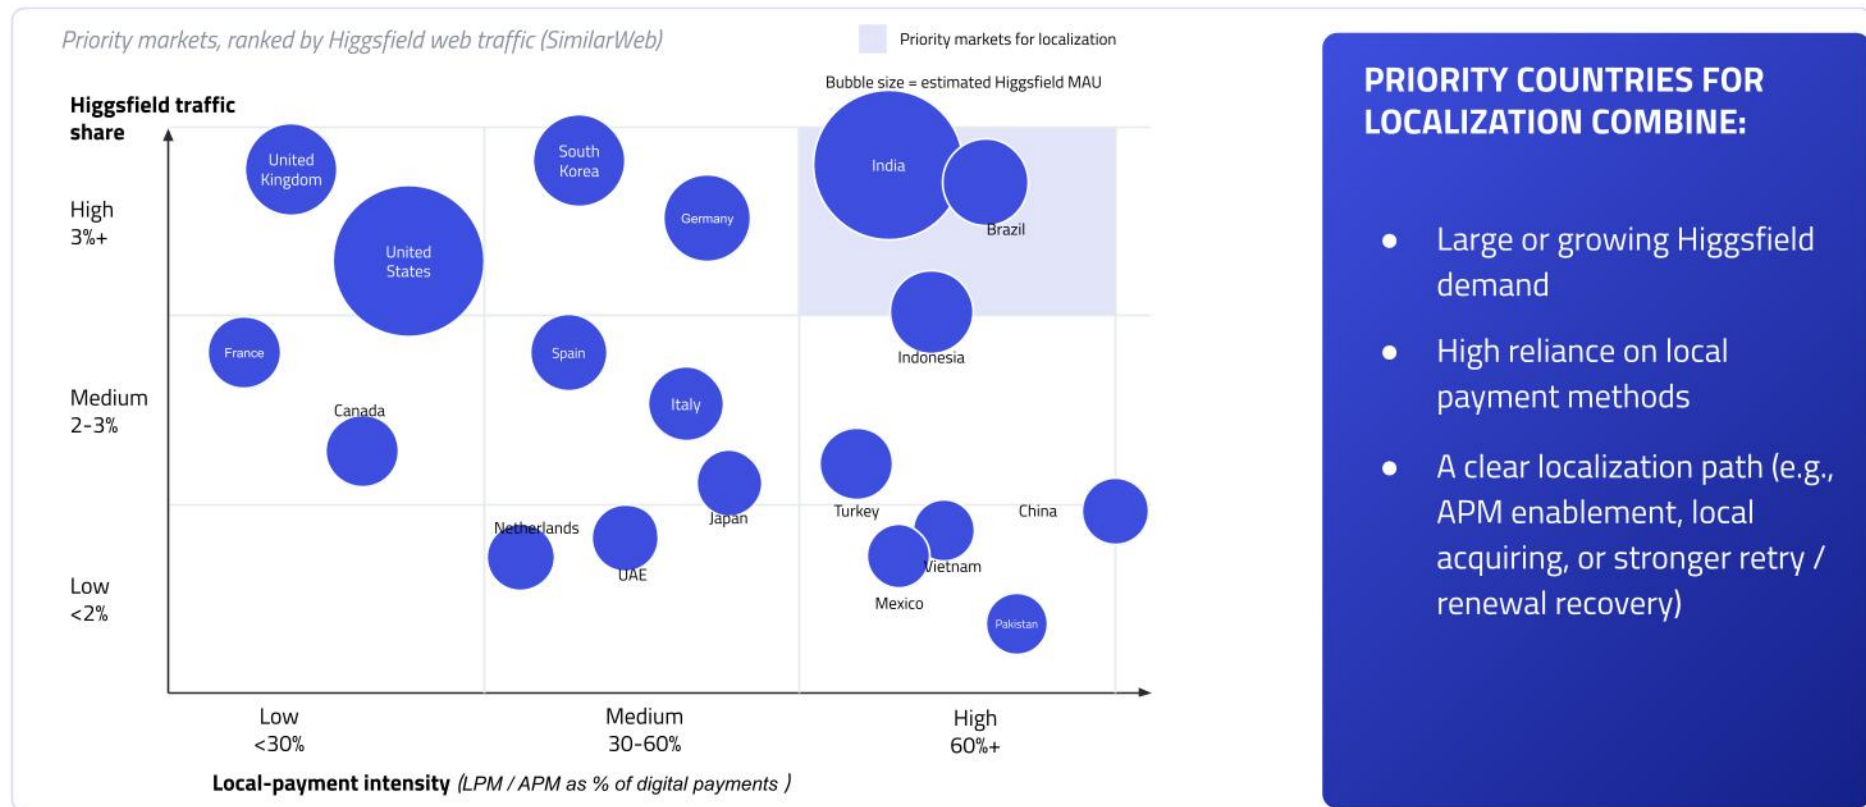

The Decision Frame

Top markets by combined three-lever opportunity

Each market shows how the three levers stack to a single combined MRR

Localization matters most where Higgsfield already has demand and where local payment behavior is strong

THE REALITY

A second-PSP integration captures ~\$6M/year. Yuno orchestration captures the full ~\$25M

~\$6M/YR

Estimated incremental revenue

Stripe + 2nd PSP (direct)

- Adds LPMs in ~8 to 10 markets where the 2nd PSP has coverage
- Limited depth in Pakistan, Vietnam and Turkey local rails
- No cross-PSP retry (Lever 3 mostly lost)
- Authorization uplift limited to one provider's routing
- ~25% of the addressable opportunity

~\$25M/YR

Estimated incremental revenue

+ Yuno Orchestration

- Includes Adyen + Stripe + 30 local PSPs per market
- Cross-PSP retry unlocks full Lever 3 (~\$2.8M/yr)
- Multi-acquirer routing maximizes Lever 2 (~\$1.3M/yr)
- 100% of the addressable opportunity

Yuno ARR is ~4x the second-PSP-only ARR, because orchestration unlocks all three levers, not just partial LPM coverage.

Six Higgsfield data points convert this strategic case into a board-grade financial forecast

1 MAU, checkout starts and web vs invoice mix by country

Why Replaces the SimilarWeb-triangulated MAU with Higgsfield's actual demand baseline.

Use *Sharpens Lever 1 sizing per country*

2 Today's free→paid conversion rate by country

Why Confirms the constrained-conversion baseline; quantifies the actual gap to close.

Use *Calibrates Lever 1 'today's conv' input*

3 Card authorization rate by country, issuer/BIN and decline reason (Stripe export)

Why Identifies recoverable cross-border declines vs. hard declines; extends the 95.6% US / EU / AU benchmark to other markets.

Use *Calibrates Lever 2 decline-gap and recoverable-share assumptions*

4 Renewal and auto-refill failure rate, retry recovery and involuntary churn by country

Why Validates whether Higgsfield is at the ~38% default recovery baseline or already past it.

Use *Calibrates Lever 3 incremental recovery uplift*

5 Plan mix (Starter / Plus / Ultra, credit packs, auto-refill), Adaptive Pricing currencies, refunds, churn

Why Replaces the blended ARPU assumption (\$240 EM / \$300 DM) with Higgsfield's actual per-country economics.

Use *Sharpens MRR and annualized figures across all three levers*

6 Risk, compliance, tax and MoR feasibility by market

Why Determines whether local entity, MoR or PSP-of-record is viable per market.

Use *Implementation path and phase sequencing*

OUR COMMITMENT

A 2-week joint data sprint converts this strategic case into a Higgsfield-validated forecast

WHAT WE RUN TOGETHER · 2 WEEKS

DAYS 1-3

Data exchange

Higgsfield shares country-level checkout starts, paid conversion, payment-method mix, decline codes and renewal failure data (Stripe exports). Yuno provides standardized templates.

DAYS 4-7

Model calibration

Replace Yuno's external estimates with Higgsfield's actual funnel data. Re-run all three lever sizings with country-specific parameters.

DAYS 8-11

Implementation roadmap

Sequence top markets by combined opportunity vs implementation effort. Identify 2 to 3 pilot countries and their priority methods.

DAYS 12-14

Pilot scope & business case

Joint paper with country-level forecast, MoR / processor / tax recommendations and a phased contract proposal.

WHAT WE AIM TO GET DONE

- ✓ Country-level monetization forecast across all three levers, calibrated against Higgsfield's actual funnel data, replacing today's external estimates
- ✓ Sequenced implementation roadmap with priority markets, payment methods, and concrete provider recommendations (acquirers, MoRs, local PSPs)
- ✓ Pilot proposal for 2 to 3 countries (e.g., India + Brazil + Indonesia) with measurable conversion targets, expected MRR and contractual scope
- ✓ Risk-adjusted business case sized at Higgsfield's blended ARPU and country economics: board-grade input for payments-localization investment

BOTTOM LINE Higgsfield keeps Stripe as the global baseline. Yuno orchestrates the localization layer around it, adding methods, routing locally and recovering failures, with all economics validated against Higgsfield's own data.

A 60-day Yuno BD sprint secures wallet and distribution commitments across four regions

Integration alone isn't enough. Many wallets only activate marketing, co-branding and full market support when the merchant has a direct relationship. Yuno's BD team builds those relationships on Higgsfield's behalf, PayPal, iDEAL, Bizum and Satispay enablement in Europe included.

LATIN AMERICA	SOUTH & SE ASIA	EAST ASIA	MENA / AFRICA
     	      	     	     
Pix Automático recurring commitment + Mercado Pago co-marketing in Brazil and Mexico; SPEI / OXXO activation	UPI AutoPay mandates + Paytm / PhonePe placement; QRIS + GoPay / DANA in Indonesia; MoMo in Vietnam; JazzCash in Pakistan	Korea easy-pay completion (Toss, Samsung Pay) on top of Kakao / Naver / PayCo; Japan PayPay / Konbini; Alipay for Chinese users	UAE local acquirer contracts + Tabby / Tamara; mada / STC Pay (Saudi) and Fawry / InstaPay (Egypt) queued as wave-2 markets

What the 60-day sprint delivers

1

WALLET COMMERCIAL COMMITMENTS

Signed agreements with priority wallets per market, not just API connectivity, but marketing support, co-branding rights, and preferred merchant status.

2

LOCAL ACQUIRER CONTRACTS

Pre-negotiated acquiring agreements in India, Brazil, Turkey, Mexico and the UAE for domestic card routing from day one.

3

GO-TO-MARKET READINESS

Some wallets (GCash, Mercado Pago, Fawry) only promote a merchant if the integration is direct and the relationship is established; Yuno's BD team makes Higgsfield a named launch partner, not just another API merchant.

This isn't a software demo followed by a handoff. Yuno puts a dedicated team in the field to make sure Higgsfield has full wallet support on day one.

APPENDIX

How to read the numbers in this deck

WORKING ASSUMPTIONS

Higgsfield MAU per country

Triangulated from SimilarWeb traffic share (122-country export) and a ~12M global MAU anchor (30M+ registered users, Series B release Aug 17 2026, at ~40% monthly active; cross-checked against ~32M monthly visits). Per-country range $\pm 15\%$.

Free→paid conversion (today)

EM 0.5 to 1.5%; DM 2 to 3%. Anchored on OpenView SaaS Benchmarks and RevenueCat State of Subscription Apps; EM assumed well below the ~5.8% global average implied by a ~\$210M consumer pool at 12M MAU.

Free→paid conversion (with local methods)

EM full-stack +2.0pp (Pakistan +1.5pp); Brazil, Korea and China +0.5 to +1.0pp because Stripe already offers the main local method; mature and APM-led markets +1.0pp. Stripe optimized-checkout study cites 7 to 12% average lift.

Blended ARPU

EM markets \$240/yr (\$20/mo); DM markets \$300/yr (\$25/mo). Observed list prices (Sep 16 2026): Starter \$19/mo, Plus \$47 annual or \$59 monthly, Ultra \$99 annual or \$129 monthly, plus credit packs and \$20 to \$300 auto-refill.

Lever 2 decline gap

Cross-border decline rate 25% (EM), 15% (APM-led), 8% (DM); recoverable share 55% (EM), 40% (others); partial-year factor 0.685.

Lever 3 retry recovery

Monthly renewal failure 3.5% (EM) / 2.5% (DM); 40% of failed renewals rescued; remaining value \$120 (EM) / \$150 (DM); 0.78 incrementality haircut. Stripe Smart Retries recovers ~38% at default.

CAVEATS & POSITIONING LANGUAGE

- MAU is Yuno-triangulated: present as ranges and ask Higgsfield to validate against internal funnel data
- Sensitivity (Yuno model): 16M MAU gives ~\$34M/yr; +3.5pp EM uplift gives ~\$58M; +1.0pp EM uplift gives ~\$15M
- Capture rate (with-LPM conversion) is anchored on Stripe-published examples; should be A/B validated per market
- Levers are NOT additive: Lever 2 uses the post-Lever-1 paid base; Lever 3 uses the post-Lever-1+2 paid base
- Top 20 by traffic, 18 modeled: the United States stays on Stripe (its upside is shown on its own slide, outside the base case) and Russia is excluded under sanctions
- Never state that Higgsfield lacks a method: confirmed today are cards (Visa, Mastercard, Amex, JCB), Apple Pay and bank payments; Stripe materials add Link, Klarna, Affirm, Pix, Kakao Pay, Naver Pay, PayCo, WeChat Pay

United States: Stripe stays; PayPal, Venmo and redundancy are the upside

95.6%

Stripe auth rate (US, Europe, Australia)
Link on 40%+ of transactions (Stripe)

~1.8M

Estimated Higgsfield MAU
1.5–2.1M range; 15.1% of traffic (#1)

~9K

Incremental paid subscribers
upside, not in the ~\$25M base case

~10.9K

Total paid-subscriber impact
new + recovered subs · ~\$4.0M/yr upside

1

AUDIENCE EXPANSION

+~9K new paid subscribers

~\$2.7M/year (upside)

Add PayPal, Venmo and Cash App Pay; Stripe keeps cards, Link, Apple Pay, Klarna and Affirm

2

AUTHORIZATION UPLIFT

+~1.9K recovered approvals/yr

~\$0.4M/year (upside)

Second processor as failover; network tokens on both routes

3

RENEWAL CONTINUITY

+~7.9K renewals saved/yr

~\$0.9M/year (upside)

Cross-PSP retries and account updater on the largest paid base

PAYMENT METHOD PRIORITY

Priority	Method	Scale / penetration	Role for Higgsfield
Must-have	Cards + Link + Apple Pay (live)	95.6% auth; Link on 40%+ of transactions	Baseline stays on Stripe
Must-have	PayPal / Venmo	Help center: PayPal not supported today	Preferred-method acquisition
Optional	Cash App Pay, ACH / bank debit	Failed-card rescue	Coverage / fallback

UPSIDE MODEL (not in base case)

Current paid conversion	~3%
With PayPal + Venmo added	~3.5%
Incremental uplift	+0.5pp
Blended ARPU	~\$300/year

Local methods move conversion closer to better-monetized subscription benchmarks by removing checkout-fit friction.

SO WHAT

The home market stays on Stripe. Yuno adds a second route for redundancy, PayPal and Venmo at checkout, and renewal recovery on the largest paid base: ~\$4M/yr of upside kept out of the base case.

India: UPI is the largest audience-expansion lever in the portfolio

PAYMENT METHOD PRIORITY			
Priority	Method	Scale / penetration	Role for Higgsfield
Must-have	UPI / UPI AutoPay	555M users; 85.5% of digital volume	Primary acquisition + subscription mandate
Must-have	RuPay / local debit	Domestic card scheme	Local card acceptance
Optional	Net banking, wallets (Paytm, PhonePe)	Supplementary	Coverage / fallback

BASE-CASE MODEL	
Current paid conversion	~0.5%
With UPI + AutoPay	~2.5%
Incremental uplift	+2.0pp
Blended ARPU	~\$240/year
Local methods move conversion closer to better-monetized subscription benchmarks by removing checkout-fit friction.	

SO WHAT

India is Higgsfield's #2 market (12.5% of traffic). Its monetization path runs through UPI first; local card routing and AutoPay retries compound on top.

Russia: #3 by traffic, not addressable under current sanctions

3.82%

Share of Higgsfield traffic (SimilarWeb)
#3 market by traffic

~0.46M

Estimated Higgsfield MAU
0.39–0.53M range (Yuno-estimated)

Mar 2022

Visa and Mastercard suspended
foreign-issued cards stopped working

Feb 2024

NSPK (Mir) sanctioned by US Treasury
no compliant rail for a US merchant

1

WHY EXCLUDED

No international card acquiring

\$0 modeled

Visa and Mastercard suspended Russian operations in March 2022;
foreign-issued cards do not work in Russia

2

DOMESTIC RAILS

Domestic rails are off-limits

\$0 modeled

NSPK, the operator of Mir, is under US sanctions since February 2024

3

RECOMMENDATION

Monitor, do not build

excluded from the ~\$25M

Traffic stays in the top-20 view for completeness; revisit only if
sanctions change

PAYMENT METHOD PRIORITY

Priority	Method	Scale / penetration	Status for Higgsfield
Blocked	Mir (NSPK)	Domestic scheme; sanctioned Feb 2024	Not available
Blocked	Visa / Mastercard	Operations suspended Mar 2022	Not available
Blocked	SBP (Bank of Russia rail)	Central bank rail	Not available under current US sanctions

BASE-CASE MODEL

Current paid conversion	n/a
Modeled contribution	\$0
Incremental uplift	Opp
Blended ARPU	n/a

No revenue is modeled for Russia; the traffic is shown for completeness only.

SO WHAT

Demand is real (#3 by traffic) but there is no compliant rail for a US merchant today. Russia is excluded from the business case and kept visible in the top 20 for completeness.

United Kingdom: PayPal, Open Banking and wallets lift a card market

351M

Open Banking payments 2025 (+57%)
16.5M user connections (OBL, 2026)

RENEWAL CONTINUITY

+~900 renewals saved/yr

~\$0.08M/year

Run retries across local processors

PAYMENT METHOD PRIORITY

Priority	Method	Scale / penetration	Role for Higgsfield
Must-have	SPEI (bank transfer)	7.3B transfers in 2025	Primary acquisition rail
Must-have	Local debit / domestic cards	Leading e-commerce method	Local card acceptance
Optional	OXXO Pay, Mercado Pago	24,708 OXXO stores (Jun 2026)	Coverage / fallback

BASE-CASE MODEL

Current paid conversion	~1%
With SPEI + OXXO added	~3%
Incremental uplift	+2.0pp
Blended ARPU	~\$240/year

Local methods move conversion closer to better-monetized subscription benchmarks by removing checkout-fit friction.

SO WHAT

Mexico combines local payment-method coverage with meaningful card-approval upside; it anchors the Spanish-language LatAm funnel.

Pakistan: Raast, mobile wallets and local debit are the unlocks

60M

JazzCash registered users (Mar 2026)
Easypaisa 59M+; 92% of retail digital

~0.15M

1

AUDIENCE EXPANSION

+~2.3K new paid subscribers

~\$0.55M/year

Enable Raast + JazzCash / Easypaisa

2

AUTHORIZATION UPLIFT

+~100 recovered approvals/yr

~\$0.02M/year

Prioritize debit acceptance

3

RENEWAL CONTINUITY

+~500 renewals saved/yr

~\$0.05M/year

Failed-card rescue methods

PAYMENT METHOD PRIORITY

Priority	Method	Scale / penetration	Role for Higgsfield
Must-have	JazzCash / Easypaisa	60M + 59M registered; 29M + 20M active	Primary acquisition rail
Must-have	Raast (instant A2A)	742M Raast transactions in Q3 FY26 (SBP)	Mobile-first acquisition
Optional	PayPak / local debit	57.2M of 68.3M cards are debit	Coverage / fallback

BASE-CASE MODEL

Current paid conversion	~0.5%
With wallets + Raast added	~2%
Incremental uplift	+1.5pp
Blended ARPU	~\$240/year

Local methods move conversion closer to better-monetized subscription benchmarks by removing checkout-fit friction.

SO WHAT

Pakistan's path is wallets and instant rails, not cards; a subscriber reported a card re-verification lockout in Sep 2026.

Top Lever 1 markets are driven by incremental paid users unlocked through local payment methods

The largest markets combine high Higgsfield demand, low current monetization and strong conversion uplift when local methods are enabled. Ranked by Lever 1 MRR.

#	Country	MAU (est.)	Today conv.	With-LPM conv.	Incremental paid users	Lever 1 MRR
1	India	1.50M	0.5%	2.5% (+2.0pp)	30.1K	\$0.60M
2	Indonesia	0.35M	0.5%	2.5% (+2.0pp)	6.9K	\$0.14M

CONCENTRATION

TOP 3 MARKETS

~47%

India · Indonesia · UK

TOP 10 MARKETS

~78%

of Lever 1 MRR

Levers 2 and 3 are targeted optimization layers

They matter most where users already have payment intent, but card authorization or renewal recovery prevents revenue from being captured.

2

LEVER 2 · AUTHORIZATION UPLIFT

Fix declined card payments

~\$0.11M/month
preliminary MRR

Most relevant where:

- Cross-border card declines are high (Brazil, Mexico, Turkey)
- Domestic card schemes matter (RuPay, TROY, Cartes Bancaires)
- Local acquiring / MoR can reduce issuer risk

PRIORITY EXAMPLES

Brazil · Mexico · Turkey · India · South Korea · UK

3

LEVER 3 · SUBSCRIPTION CONTINUITY

Save failed renewals

~\$0.24M/month
preliminary MRR

Most relevant where:

- Paid subscriber base is large (more renewal events)
- Renewal and auto-refill failures (issuer declines, expired cards)
- Single-provider dependency creates involuntary churn

PRIORITY EXAMPLES

India · UK · Germany · Brazil · South Korea · Spain · Italy

WHERE LEVERS 2 AND 3 STACK · MARKET ROADMAP IMPLICATION

Market	Lever 2: Auth uplift	Lever 3: Renewal recovery	Role in roadmap
Brazil	High	High	Full-stack localization
India	Medium	High	UPI first; mandate retries on AutoPay
Mexico	High	Medium	Local acquiring + retries
South Korea	Medium	High	Local acquiring + token management
Turkey	High	Medium	Local scheme (TROY) + retries
United Kingdom	Medium	High	PayPal + Open Banking; retry optimization
Japan	Medium	High	Local trust + retry optimization
Germany	Low	High	PayPal / SEPA DD; SCA / retry optimization

LEVER 1

Audience expansion through local payment methods

~\$1.8M/mo · ~\$21M annualized · ~83K incremental paid subscribers

Lever 1 sizing: how local payment methods convert existing Higgsfield users into paid subscribers

Incremental revenue is estimated by applying a local-payment conversion uplift to existing Higgsfield demand in each priority market.

$$\text{Incremental MRR} = \text{Higgsfield MAU} \times \text{Local-method conversion uplift} \times \text{Blended ARPU}$$

Local-method conversion uplift = with-local-method paid conversion – today's paid conversion

WORKED EXAMPLE · INDIA

Higgsfield MAU	~1.5M
Today's paid conversion	~0.5%
With-UPI paid conversion	~2.5%
Incremental conversion uplift	+2.0pp
Incremental paid subscribers	~30K
Blended ARPU	~\$20/month
Incremental MRR	~\$0.60M/month

IMPORTANT

This is not a claim that every UPI, Pix or wallet user is incremental.

It estimates how much existing Higgsfield demand could convert once preferred local payment methods are available.

Today's conversion baseline reflects a constrained funnel; with-LPM conversion converges toward better-monetized subscription benchmarks.

LEVER 2

Authorization uplift through localized card processing

~\$0.11M/mo · ~\$1.3M annualized · ~7K recovered subscribers

Lever 2 sizing: converting failed card attempts into paid subscribers

Some users already want to pay by card, but cross-border routing makes the transaction look foreign to their bank. Local processing recovers those avoidable declines.

$$\text{Lever 2 MRR} = \text{Card attempts} \times \text{Avoidable decline gap} \times \text{Recoverable share} \times \text{Blended ARPU}$$

$$\text{Avoidable decline gap} = \text{cross-border decline rate} - \text{local-processing decline rate} \cdot \text{first-year revenue} \times 0.685 \text{ partial-year factor}$$

WORKED EXAMPLE · BRAZIL

$$\sim 7.9\text{K card attempts} \times 25\% \text{ avoidable decline gap} \times 55\% \text{ recoverable}$$

$$= \sim 1.1\text{K recovered paid subscribers}$$

$$\times \sim \$20/\text{month ARPU} \times 0.685 \text{ partial year} = \sim \$15\text{K/month}$$

PORTFOLIO ESTIMATE $\sim \$0.11\text{M/month preliminary gross MRR from localized authorization uplift across the 18 markets}$

IMPORTANT

Lever 2 is not about finding new users.

It recovers users who already tried to pay but were declined because the transaction was routed cross-border.

We exclude hard declines (fraud, insufficient funds, expired cards) through the recoverable-share assumption.

LEVER 3

Subscription continuity through retries and redundancy

~\$0.24M/mo · ~\$2.8M annualized · ~27K renewals saved annually

Smart retries and provider redundancy recover failed renewals: recurring revenue that compounds annually

1 Existing paid base

After Levers 1 & 2 unlock, total paid base in market that has monthly renewal events.

Portfolio post-Yuno paid: ~192K

2 Monthly involuntary failure rate

% of monthly renewals that fail before any retry. Mostly issuer declines and expired/replaced cards.

EM 3.5% · DM 2.5% (Yuno assumption)

3 Today's recovery (baseline dunning)

Stripe Smart Retries default recovers ~38% of failed payments. Anything beyond is incremental.

Higgsfield today: Stripe retries, ~14-day cure window

4 Yuno incremental recovery

Multi-PSP fallback, network tokenization, Account Updater, dunning cadence: 40% of failed renewals rescued.

0.78 incrementality haircut applied

5 Lever 3 MRR

Recovered renewals × remaining value (\$120 EM / \$150 DM) × 0.78 incrementality haircut.

Portfolio: \$0.24M/mo · \$2.8M annual
