

Powering financial infrastructure **at global scale**

The infrastructure layer that expands your payment capabilities — more methods, more markets, more intelligence — all under your brand.

Three forces reshaping the PSP landscape

Commoditization pressure is accelerating

Merchants increasingly evaluate PSPs on coverage, approval rates, and intelligence — not just processing. PSPs that don't expand their capabilities risk being reduced to a commodity rail.

Data Rich, Insight Poor

Banks sit on transaction data across multiple gateways but have no unified layer to extract value. Fintechs are using AI to close the gap — turning payment data into routing intelligence, fraud prevention, and merchant insights.

Ecosystem Fragmentation

15-30 integrations drain engineering capacity. 70-80% of payments budgets go to maintenance instead of new capabilities. Multi-market PSPs face this multiplied: separate stacks, separate methods, separate compliance requirements per country.

Global payments continue to grow, but market structure is being reshaped

Global payments revenues keep growing, though growth is slowing

Retail payment flows are shifting from card-only rails to a mix of instant A2A, account transfers and wallets

Fragmentation is accelerating: local rails, schemes and “payment sovereignty” are breaking the old global, card-centric model

New rails and platforms are shifting value: instant A2A, wallets, stablecoins and software platforms erode card margins and move economics toward multi-rail integrators.

AI-native operations are now hygiene: GenAI and agents run fraud, compliance, liquidity and routing, widening the gap between efficient and lagging players

PSPs are rewiring their stacks to keep up: moving from single-method processors to multi-rail, API-based platforms powered by AI and external partners — or risk losing ground to more capable competitors.

A three-layer growth strategy for your payments business

Each layer compounds on the last: the first expands your payment capabilities and reach, the second deepens the value you deliver to every merchant, the third makes your platform structurally indispensable — increasing revenue per merchant at every step.

01 THE FOUNDATION

Payment Technology Layer

WHAT WE OFFER

Single integration adding APMs, local rails, and global payment methods to your existing stack. Smart routing across your full provider network. White-label orchestration for online and POS — without rebuilding your infrastructure.

YOUR OUTCOME

Expand your addressable market, improve authorization rates across your merchant portfolio, and offer more payment methods than your competitors — without adding engineering complexity.

02 THE MULTIPLIER

Value Added Services

WHAT WE OFFER

Tokenization, 3DS, Passkeys, Fraud Management, and AI-powered intelligence: NOVA (43% fraud recovery), Payment Concierge, anomaly detection — all under your brand.

YOUR OUTCOME

You evolve from payment rail to intelligence layer, deepening the commercial relationship with every merchant and increasing revenue per account.

03 THE PLATFORM

Integration as a Service

WHAT WE OFFER

Composable integration layer connecting merchants to KYC/KYB, risk models, personalization, and commerce infrastructure — through a single connection.

YOUR OUTCOME

You become a platform partner, not a commodity processor. Your merchants connect once to you and inherit the entire ecosystem — making your PSP harder to replace.

Each layer moves your PSP from payment rail to infrastructure partner.

Expand your network, optimize every transaction — without rebuilding your stack

One integration adds the methods you don't have today. One routing engine optimizes every transaction across your full network — automatically.

One integration, 1,000+ new payment methods

Your PSP makes one connection to Yuno and instantly gains access to APMs, local rails, wallets, and schemes across 190+ countries. New methods activate by configuration — no new integrations, no engineering per provider.

Smart Routing Engine

Routes every transaction across your full provider network to the highest-performing option based on BIN, issuer, currency, time-of-day, and historical approval data. Static gateway rules become real-time decisions.

+3–8pp approval uplift · 15–25% acquiring cost reduction

TRANSACTION FLOW

Many providers, one decision

Security, identity, and AI — the layer that separates you from a commodity provider

Conversion, security, and intelligence primitives built into the same platform — so your merchants get more without you building more.

Integrated checkout

Hosted checkout with embedded payment methods, fraud checks, and consumer authentication in one merchant-branded surface. Not a redirect.

Tokenization

Network token provisioning and lifecycle management. Credentials vaulted, rotated, and routed without raw card data touching the merchant.

Click to Pay

Mastercard's Click to Pay integrated natively into Yuno's checkout. One-click recognition, no manual card entry.

Passkeys

Biometric authentication replacing passwords. Click to Pay with Passkey, fingerprint or face confirms payment.

3D Secure

EMV 3D Secure integrated into the checkout flow for frictionless, risk-based authentication.

Tap to Pay

In-person acceptance turning any device into a terminal. New acceptance points without traditional hardware.

Connectivity is the entry point. Checkout, identity, fraud protection, and AI ship with it.

One connection to everything your merchants need

Your PSP becomes the integration layer. Merchants connect once, to you, and inherit the entire ecosystem.

460+ providers pre-connected. No new integrations needed.

KYC/KYB, fraud, tax, payout — all accessible through your brand.

Keep the merchant relationship, the brand, and the commercials. Yuno is the engine underneath.

> what_unlocks

Four levers your platform can unlock

Each one is measurable, already proven across our portfolio, and live the moment your platform activates.

01

+3-8_{pp}

Authorization rate

Approval uplift

Smart routing picks the highest-performing acquirer per BIN, issuer, and time-of-day. Every percentage point of uplift translates directly into captured revenue.

02

15-25%

Acquiring cost reduction

Cost optimization

Eligible card volume routes through domestic rails when the economics beat international scheme fees. Cost-differential routing closes the gap on every transaction.

03

Days

Time to a new method

APM activation

New payment methods activate by configuration, not engineering. From 3-6 months per gateway to days, with 1,000+ methods pre-connected on the platform.

04

30-40%

Ops time reduction

Ops consolidation

One reconciliation, one dashboard, one dispute workflow across every gateway. Finance closes books in hours instead of days, with no provider lock-in.
